

Continuous Evolution. Premium Experience.

The Journey of the Local Video
Feed App (v0.1 – v0.5)

A Private Ecosystem Built Exclusively for Your Library

A Track Record of Uncompromising Iteration

Not just bug fixes. Every release is a major leap forward in user experience, performance, and capability.

v0.1

The Foundation
Complete baseline
architecture & feed
algorithm.

v0.2

**Interface
Stabilization**
Tidy, fixed-geometry
layouts.

v0.3

**Premium UX
Overhaul**
Role-based motion
& accessible design.

v0.4

**Performance
Rebuild**
Server-side
thumbnail caching.

v0.5

**Runtime
Hardening**
Threaded servers
& unbreakable data.

Pillar 1: The Intelligent Foundation

The 3-Bucket Engine

A customizable 5/3/2 ratio blending Ranked (favorites), Fresh (unseen), and Cooldown (snoozed) (snoozed) videos.

Nuanced Feedback

Beyond just likes. Soft dislikes (-0.5 score) gently deprioritize content without banishing it.

Systematic Curation

A dedicated, built-in "To Be Deleted" bucket enables safe, bulk removal of junk files directly from the app interface.

Pillar 2: Crafting a Calming, Premium Layout

■ Fixed-Geometry Stability

The Settings window is locked to a comfortable 520x460 size. Tab content scrolls internally, meaning the app never jitters or resizes as you navigate.

■ Spatial Respect

Interface elements respect your screen real estate with responsive typography and premium system font stacks.

■ Tailored Aesthetics

21 fixed tag color swatches and a custom white/black/red barycentric background blender ensure your feed looks stunning on any monitor.

The Motion System: Interfaces That Respond to Touch

Anatomy of a Premium Card

Resting	Hover	Pressed
		
Tactile Micro-Animations Elements don't just appear. They ease in beautifully and respond with a spring-like bounce when tapped.	Typographic Craft Tabular numerals keep score badges perfectly steady, resting on an eased legibility shadow to prevent banding.	Considerate Design Fully operable via keyboard, featuring visible focus rings and strict adherence to OS 'Reduce Motion' accessibility preferences.

Pillar 3: Blazing Grid Performance

The Old Way

Your browser worked overtime to decode every video into an image, spinning up fans and draining battery.

The Breakthrough

A dedicated background pre-warmer silently generates tiny, highly optimized thumbnails (~14 kB JPEGs) in under 0.2 seconds.

The Result

The video grid loads instantly. Zero lag.
No laptop heat.

Pillar 4: A Rock-Solid, Frictionless Runtime

Threaded Server Architecture

Video streaming now operates on entirely independent threads. Scrubbing through heavy video files will never block the app from saving your preferences.

In-Memory Caching

The app no longer wastes time re-reading your database on every click. Everything is held instantly in memory, keeping the entire application feeling weightless.

Focused Efficiency

Infinite background UI animations were stripped away, replacing constant rendering loops with static, premium loading sheens.

Unbreakable Data Preservation

Write Temp

Verify Completion

Rename & Commit

Process Overview: Atomic Save Operation

The Threat

A sudden computer crash while saving your ratings could historically corrupt your entire library database.

The Solution

An implementation of "Atomic Saves." The app executes a flawless write-temp-then-rename operation.

The Benefit

Your categories, scores, and viewing history are now structurally immune to corruption. Total peace of mind.

Scalable, Frictionless Deployment Anywhere

One-Click Launch

Simple double-clickable launcher scripts (start.bat for PC, .command for Mac) instantly boot the local server and open the browser interface.

Zero Dependencies

Operates flawlessly across all modern web browsers without requiring external frameworks, CDN connections, or plugins to function.

Self-Contained Ecosystem

From Python Flask to HTML rendering, everything runs right from your local folder. No setup required.

The Evolution Matrix: Baseline vs. Today

Feature Dimension	Baseline (v0.1)	Today (v0.5)
Grid Loading	Staggered & Heavy CPU Load	☒ Instant & Server-Cached
Interaction Motion	Generic & Abrupt	☒ Tactile, Role-Based & Accessible
Data Safety	Standard Overwrites	☒ Corrupt-Proof Atomic Saves
Video Playback	Sequential & Blocking	☒ Multithreaded & Seamless Scrubbing
App State	Jittery Window Resizing	☒ Fixed-Geometry & Calm

Synthesis: The Complete Viewing Ecosystem

The app is no longer just a functional script; it is a carefully balanced machine.

Ecosystem Synergy

The blazing threaded backend perfectly supports the heavy algorithmic sorting, which in turn feeds the premium, smooth frontend UI. Every layer empowers the next to deliver an unparalleled, distraction-free viewing experience.

A Foundation Built for Tomorrow

The evolution from v0.1 to v0.5 proves a relentless commitment to perfection. As long as there are ways to make the experience faster, safer, and more beautiful, the active development continues.

Local Video Feed App — Constantly Iterating. Always Yours.
